**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Currently Amended) A printhead assembly, comprising:

at least one printhead module comprising at least two printhead integrated circuits, each of which has nozzles formed therein for delivering printing fluid onto the surface of print media, a support member supporting the at least two printhead integrated circuits and having at least one longitudinally extending channel for carrying the printing fluid, and an electrical connector for connecting electrical signals to the printhead integrated circuits;

a casing comprising an elongate support frame removably mounting the at least one printhead module and ~~at least one~~ controller for processing print data and controlling at ~~least one of the~~ at least two printhead integrated circuits to print the processed print data via the electrical connector; and

at least one connector arrangement arranged in a housing mounted to at least one longitudinal end of the support frame and carrying at least one power terminal for connecting the electrical connector to a power supply, ~~at least one~~ data terminal for connecting the controller to a data input, and at least one fluid delivery port for connecting the at least one channel of the support member to a fluid supply via fluid delivery tubes, the housing being configured to allow connection of the power and data terminals and fluid delivery port to the respective power supply, data input and fluid delivery tubes.

2. (Previously Presented) A printhead assembly according to claim 1, wherein two connector arrangements are provided comprising a first connector arrangement carrying the power and data terminals and the fluid delivery port at one longitudinal end of the support frame and a second connector arrangement at the other longitudinal end of the support frame spring loading at least one first printed circuit board on which the controller is carried in the direction of the first connector arrangement.

Appln No. 10/760,227

3

3. (Original) A printhead assembly according to claim 2, wherein:  
the first connector arrangement is a second printed circuit board and the second connector arrangement is a third printed circuit board; and  
the at least one first printed circuit board is engaged at the one end of the support frame by the second printed board and is engaged at the other end of the support frame by a spring portion formed in the third printed circuit board.
4. (Cancelled)
5. (Previously Presented) A printhead system according to claim 3, further comprising a plurality of longitudinally extending electrical conductors connected to the second printed circuit board for delivering the power from the power supply to the controller and printhead integrated circuits via the electrical connector.
6. (Original) A printhead system according to claim 3, wherein the third printed circuit board carries another power terminal of the at least one power terminal and another fluid delivery port of the at least one fluid delivery port.
7. (Previously Presented) A printhead system according to claim 6, further comprising a plurality of longitudinally extending electrical conductors arranged as two groups of electrical conductors respectively connected to the second and third printed circuit boards for delivering the power from the power supply to the controller and printhead integrated circuits via the electrical connector at respective ends of the printhead assembly, respective ones of electrical conductors of the two groups of electrical conductors being connected together at abutting regions intermediate the ends of the printhead assembly.
8. (Original) A printhead assembly according to claim 7, wherein the abutting regions of the individual electrical conductors are arranged in overlapping relationship.
9. (Original) A printhead assembly according to claim 6, wherein the third printed circuit board comprises termination connections for terminating a data signal traversing the at least one first printed circuit board from the second printed circuit board.

Appln No. 10/760,227  
Amdt. Dated November 17, 2006

4

10. (Original) A printhead assembly according to claim 1, wherein:

the at least one printhead module is formed as a unitary arrangement of the at least two printhead integrated circuits, the support member, the electrical connector, and at least two fluid distribution members each mounting one of the at least two printhead integrated circuits to the support member; and

the support member has a plurality of apertures extending through a wall of the support member arranged so as to direct the printing fluid from the at least one channel to associated nozzles in both, or if more than two, all of the printhead integrated circuits by way of respective ones of the fluid distribution members.
